Commentary

During the worldwide pandemic of COVID-19, Female patient 38 years old, underwent laparoscopic sleeve gastrectomy for her obesity. Her preoperative BMI was 45 kg/m². She was suffering from calcular cholecystitis and DM. During surgery there were some bleedings from the proximal part of the staple line that took some time to be controlled with a small constant hematoma 2x2 cm left behind.

During the operation, the surgeon struggled to perform cholecystectomy through the same ports of sleeve gastrectomy without adding more ports claiming to give the patient best cosmesis.

The first postoperative days were noneventful except some ammount (100-200 cc) of bile discharge from the right subhepatic drain that continued to decrease gradually over 7 days where the drain was removed. The left subhepatic drain gives few dark serosanguinous discharge and was removed on the second postoperative day.

The patient tolerated oral fluids for two days then partially semisolids.

On the tenth postoperative day she developed fever (38.4°C), tachycardia (115 b/m), tachypnea (27 c/m) with complaint of shortness of breathing. BP is 100/70 mmhg. Hb is 9.8gm%, WBCs 15600 with lymphocytes are 20% and neutrophiles are 74%. O₂ saturation at room air is 91% and CRP 84.

You are invited to manage this case, how can you do?

(200 Marks)

Good luck
